Fingertip access to every document, anytime, everywhere!

In today's mobile world, your people need documents everywhere, all the time. Unfortunately, your critical information isn't always accessible when and where it is really useful.

Until now.

Introducing WebView for DocSTAR™ electronic filing systems. This optional software enables documents stored on a host DocSTAR to be viewed from any computer via the Internet or corporate intranets. It works with wide-area networks, broadband Internet services, or even dial-up connections!

Now you can put documents at the fingertips of your customers, field employees, other important people, and even the general public—everywhere, at any time! And of course you can restrict this access to only those who really need it.

Easy to use

WebView is very easy to use because it combines the simplicity of a Web browser with the DocSTAR system's powerful search and retrieval features.

The browser based user interface closely resembles DocSTAR View Software. It's as easy as surfing the Net: login, perform searches, and View your documents.

Easy to support

WebView is very easy to support because it features a "thin client" design. You install software only on the host DocSTAR system. There is no dedicated application on each "client" computer. You minimize technical-support time, costs and headaches! Everything is centrally managed from the DocSTAR Host.

All Series 3 Systems running v3.1 can be enhanced with the WebView Module. WebView will install directly to the Enterprise/Departmental Systems and upgrades are available for the Workgroup/Workgroup Pro Systems.

Add accessibility without subtracting security

While open to the Internet, WebView provides the same level of security for which you've come to trust DocSTAR. Create user identities and passwords. Permit varying levels of access. Use Secure Socket Layer (SSL) connections. And of course, rely on DocSTAR's exclusive AuthentiDate™ technology

to assure that your documents have not been altered.

System Requirements

DocSTAR host system running Microsoft Windows 2000 Server or later and related Internet services software (Series 3 Enterprise/Departmental Systems or Upgraded Workgroup/Workgroup Pro Systems running DocSTAR system software v3.1).

Client PC running standard Web browser software with JavaScript support enabled (e.g. Microsoft Internet Explorer 4.0 or later) connected to the Internet or a corporate intranet.

Make your documents more accessible. **Call today!**

SO EXPAND ACCESS TO YOUR CRITICAL DOCUMENTS.
